May 21, 2007*

## **Fire Blight Alert !!! -- Again**

According to the Maryblyt model and the predicted temps. through the next 7 days, there is again a very HIGH risk of infection if there are any apple blossoms open and there is a wetting event starting on Thursday, May 24, through Sunday, May 27 (which is the furthest out we can predict as of today).

Also, we are still in the high risk period for apple scab primary infection. To say the least, it is an important time in disease management.
